Case Study 2: Okonkwo FinTech Solutions

Designing a Proactive Customer Health and Product Adoption Recovery System for BukkiBooks

Project: Customer Success and Customer Health Case Study
Industry: FinTech / Cloud Accounting Software
Product: BukkiBooks
Customer: Ihuoma Fashion House
My focus: Customer Health Monitoring | Product Adoption | Customer Retention | Proactive Engagement | Workflow Automation
Project type: Customer success case study and proposed solution

---

1. Executive Summary

Okonkwo FinTech Solutions provides BukkiBooks, a cloud-based accounting and invoicing product.

One of its customers, Ihuoma Fashion House, had stopped reconciling inventory for five weeks after a new manager joined the business without adequate product training.

At first glance, this might appear to be a product usage issue. However, from a Customer Success Management perspective, it presented a wider concern.

A customer was no longer using an important product workflow, and a change in personnel had introduced a possible knowledge gap.

If the issue remained unresolved, the customer could continue receiving less value from the product, lose confidence in its usefulness, and become increasingly disengaged.

I approached this as a customer adoption and retention risk rather than waiting for the customer to raise a support complaint or request cancellation.

My proposed solution combines product usage monitoring, customer health tracking, automated risk alerts, personalised CSM outreach, targeted training, and post-intervention monitoring.

The goal is not simply to make the customer log in again. It is to help the customer successfully resume inventory reconciliation and continue using the product to support business operations.

---

2. Customer and Business Context

Customer: Ihuoma Fashion House
Product: BukkiBooks
Business: Fashion retail
Issue: Inventory reconciliation inactive for five weeks
Triggering event: A new manager joined without adequate product training.

The case highlighted an important customer success challenge: product adoption can be affected by changes within the customer's own organisation.

A product may have been successfully adopted by one employee, but when that employee leaves or responsibilities change, the new user may not have the knowledge required to continue using important features.

Without a structured handover or role-specific onboarding process, an otherwise healthy customer relationship can develop an adoption gap.

The Core Problem

The customer had stopped using a key product workflow for an extended period.

The business did not have an effective early-warning and intervention process to identify the adoption gap and ensure the new manager received the support required.

The customer success challenge was therefore twofold:

1. Identify and understand why the important workflow had stopped.
2. Restore successful product adoption through an appropriate customer intervention.

---

3. Problem Analysis

I broke the problem into four areas.

A. Prolonged feature inactivity

Inventory reconciliation had been inactive for five weeks.

This was a meaningful signal because the workflow was important to the customer's use of the accounting and invoicing product.

However, inactivity alone does not establish dissatisfaction or an intention to cancel.

It indicates a need to investigate.

B. Change in customer personnel

A new manager had joined the business.

This introduced a possible gap in product knowledge and workflow ownership.

The new manager may not have known:

- Where to find the inventory reconciliation feature.
- How to complete the reconciliation process.
- How inventory records were previously maintained.
- What to do when an error occurred.
- Where to access product guidance or support.

These are questions to validate during customer engagement, not assumptions to present as confirmed facts.

C. Inadequate onboarding and knowledge transfer

The new manager had not received adequate product training.

This suggested that the customer needed more than a generic reminder to use BukkiBooks.

The intervention needed to address the specific workflow and the new manager's ability to complete it independently.

D. Lack of early-warning intervention

The five-week period of inactivity indicated an opportunity for a proactive customer health monitoring process.

If important feature inactivity had been detected earlier, the Customer Success team could have investigated and provided assistance before the problem continued for several weeks.

---

4. Customer and Business Impact

The immediate issue was the interruption of inventory reconciliation.

From a customer success perspective, this could have broader implications.

Area	Potential impact
Product adoption	Reduced use of an important product feature
Customer confidence	New manager may feel uncertain using the product
Business operations	Inventory information may become less current or reliable
Product value	Customer may receive less value from the subscription
Customer relationship	Continued difficulty may reduce engagement
Retention	Prolonged disengagement may increase renewal risk

The case information confirms the five-week interruption and inadequate training. It does not establish that Ihuoma Fashion House had decided to cancel or that a financial loss had occurred.

I therefore treated retention as a risk to manage, not an outcome already known.

---

5. My Approach as a Customer Success Manager

I would manage the situation through a structured customer success intervention.

Step 1: Review the customer's usage history

Before contacting the customer, I would review the available product usage information.

I would want to understand:

- When was the last successful inventory reconciliation?
- How frequently was the feature used before the interruption?
- Which user previously completed the workflow?
- Has the new manager logged into BukkiBooks?
- Are other features still being used?
- Has the customer encountered recent errors?
- Have there been recent support requests?

Why this matters

It helps distinguish between a general decline in product usage and a specific feature adoption problem.

For example, if the customer is still using invoicing but has stopped reconciling inventory, the intervention should focus on inventory reconciliation rather than restarting the customer's entire onboarding journey.

Step 2: Assess customer health

I would review the account using a combination of product usage, customer engagement, support history, and organisational changes.

I would not rely on one usage metric to determine customer health.

Suggested customer health dimensions

Dimension	What I would examine	Why it matters
Product adoption	Usage of important features	Shows whether the customer is receiving product value
Engagement	Recent interactions and check-ins	Helps identify declining engagement
Support experience	Open tickets and repeated issues	Highlights unresolved friction
Customer stakeholders	Changes in users or administrators	Identifies training and ownership gaps
Customer feedback	Satisfaction and concerns	Adds context to product usage data
Renewal context	Upcoming renewal or contract milestones, if available	Helps prioritise account planning

Step 3: Classify the adoption risk

Based on the case information, I would flag Ihuoma Fashion House for an adoption review because its important inventory workflow had been inactive for five weeks.

The account should be classified as requiring intervention, with the exact health status determined by the organisation's agreed customer health framework.

I would avoid automatically labelling the customer as a churn risk without additional evidence.

Step 4: Contact the customer with context

I would reach out to the customer using a personalised message.

The objective would be to understand what had changed and offer useful support.

Example CSM outreach

Subject: Helping your team resume inventory reconciliation in BukkiBooks

Hi Ihuoma,

I noticed that inventory reconciliation has not been completed in BukkiBooks recently, and I wanted to check whether your team needs any assistance.

I understand there has been a change in management, so I would be happy to arrange a short walkthrough for your new manager and help them get comfortable with the inventory reconciliation process.

We can also review any challenges your team may be experiencing and make sure you have the right guidance to continue using the feature confidently.

Please let me know a convenient time for a session.

Best regards,
Customer Success Team

Why I would use this approach

- It refers to a specific customer activity.
- It acknowledges the organisational change without making assumptions.
- It offers practical help.
- It makes the next step easy.
- It positions the CSM as a partner rather than someone chasing product usage.

Step 5: Identify the actual blocker

During the conversation, I would establish whether the issue was caused by:

- Lack of product training.
- Difficulty navigating the feature.
- A change in internal processes.
- Missing or incorrect data.
- A technical problem.
- Unclear responsibility for completing reconciliation.

This step is essential.

If the issue is a knowledge gap, training is appropriate.

If the issue is technical, I would involve the support or product team.

If the issue is a process or ownership gap, I would help the customer identify who should be responsible for the workflow.

Step 6: Deliver a targeted intervention

Based on the identified cause, I would arrange a personalised onboarding or refresher session for the new manager.

Proposed training agenda

1. Understand the customer's current inventory process.
2. Review the relevant BukkiBooks inventory features.
3. Demonstrate how to complete inventory reconciliation.
4. Walk through a practical example.
5. Explain common errors and how to resolve them.
6. Allow the new manager to complete the process independently.
7. Confirm understanding and provide relevant support resources.

I would not end the session after demonstrating the feature.

I would ask the new manager to complete the workflow themselves so that I could confirm their understanding.

Step 7: Follow up and confirm adoption recovery

After training, I would monitor the customer's product activity.

I would check:

- Whether inventory reconciliation had resumed.
- Whether the new manager could complete the workflow independently.
- Whether the customer encountered any additional difficulties.
- Whether the workflow continued to be used over subsequent periods.

I would also arrange a follow-up check-in to confirm that the customer was comfortable with the process.

Success would be measured by resumed and sustained workflow usage, not simply by attendance at a training session.

---

6. Proposed Customer Health Monitoring System

To prevent similar situations from going unnoticed, I proposed a proactive customer health monitoring workflow.

Recommended tools

Tool	Proposed purpose
Mixpanel	Monitor important product usage and feature activity
HubSpot	Maintain customer health information and account records
Zapier	Automate alerts, task creation, and workflow updates
Slack / Email	Notify the assigned Customer Success Manager

These tools represent a proposed architecture. Actual integration availability, event tracking, and data access would need to be validated.

Workflow Design

Stage 1: Monitor product activity

Track important product events, especially those linked to customer value.

For Ihuoma Fashion House, inventory reconciliation would be a key adoption event.

Stage 2: Detect inactivity

Define an appropriate threshold for when a key workflow has been inactive.

For example, a workflow that has not been completed for an agreed number of days could trigger an adoption review.

The five-week inactivity in this case would qualify for investigation.

Stage 3: Validate the risk signal

Before generating a customer risk alert, check:

- Whether the feature is expected to be used regularly.
- Whether the customer has changed users or administrators.
- Whether other important product features are still active.
- Whether the inactivity could be normal for that customer.

This reduces unnecessary alerts.

Stage 4: Update the customer health record

HubSpot would contain the relevant customer health information, including:

- Account name.
- Assigned CSM.
- Key feature inactivity.
- Last successful workflow date.
- Current adoption concern.
- Recent support activity.
- Customer engagement history.
- Next action.
- Follow-up date.
- Current health status.

Stage 5: Create a CSM task

The automation creates a task for the assigned CSM.

Example:

Task: Contact Ihuoma Fashion House regarding inventory reconciliation inactivity.

Reason: Key workflow inactive for five weeks following a management change.

Required action: Validate the adoption blocker and arrange appropriate assistance.

Stage 6: Notify the CSM

Send a Slack or email notification containing the account, risk signal, relevant context, and required next action.

Stage 7: Engage the customer

The CSM reviews the alert and contacts the customer personally.

The automation should support the relationship, not replace the CSM's judgement.

Stage 8: Track the intervention

Record the action taken, training completed, technical escalation if required, and next follow-up date.

Stage 9: Confirm recovery

Monitor whether the customer resumes inventory reconciliation and whether usage remains consistent.

Stage 10: Update customer health

Update the account's health status based on validated evidence of recovery.

---

7. Proposed Customer Health Framework

I would introduce a simple health framework to make account risks easier to identify and manage.

Health status	Example indicators	Recommended CSM response
Healthy	Key features used consistently, positive engagement, no significant unresolved issues	Maintain engagement and identify opportunities for additional value
Needs Attention	Declining usage, isolated feature inactivity, unresolved questions	Investigate and provide targeted guidance
At Risk	Prolonged inactivity in an important workflow, multiple unresolved issues, significant disengagement	Prioritised outreach, recovery plan, and closer monitoring
Recovery in Progress	Customer has engaged with the intervention but sustained adoption is not yet confirmed	Monitor usage and maintain follow-up
Recovered	Key workflow has resumed and the customer has demonstrated successful usage	Confirm outcome and return to an appropriate engagement cadence

The health framework should be adapted to the product's usage patterns and customer lifecycle.

A customer who uses a feature monthly should not be flagged as unhealthy simply because they did not use it every week.

---

8. Customer Success Action Plan for Ihuoma Fashion House

Action	Owner	Timing	Expected outcome
Review product usage history	CSM	Before outreach	Understand the adoption gap
Validate the reason for inactivity	CSM	Initial customer conversation	Confirm the actual blocker
Review technical issues, if any	Support / Product	When identified	Resolve technical barriers
Arrange training for new manager	CSM / Product Trainer	After blocker validation	Improve product confidence
Provide workflow guidance	CSM	During intervention	Enable independent usage
Monitor inventory reconciliation	CSM / Product Analytics	After training	Confirm adoption recovery
Conduct follow-up check-in	CSM	Agreed follow-up date	Identify remaining challenges
Update customer health record	CSM	Throughout intervention	Maintain accurate account status

---

9. Success Metrics and Measurement

I would measure the success of this intervention at three levels.

A. Adoption Recovery

Inventory reconciliation recovery rate

Percentage of customers who resume inventory reconciliation after an adoption intervention.

Time to adoption recovery

Time between the intervention and the customer's first successful completion of the workflow.

Key feature usage

Frequency and consistency of inventory reconciliation after recovery.

B. Customer Success Operations

Time to intervention

Time between the inactivity trigger and the CSM's first meaningful action.

Alert-to-action rate

Percentage of valid customer health alerts that result in an appropriate CSM action.

Training effectiveness

Percentage of customers who successfully complete the relevant workflow after training.

Follow-up completion rate

Percentage of planned follow-ups completed by their agreed dates.

C. Customer Relationship and Retention

Customer health recovery

Movement from an at-risk or needs-attention status to a healthier status based on validated usage and engagement.

Customer engagement

Ongoing communication and participation in agreed success activities.

Retention and renewal trends

Monitor whether improved adoption is associated with healthier renewal and retention outcomes over time.

No retention improvement or numerical result should be claimed for this case unless actual post-intervention data becomes available.

---

10. Risks and How I Would Manage Them

Risk	Potential consequence	Proposed control
Incorrect usage tracking	False inactivity alerts	Validate event tracking and product data
Alert fatigue	CSMs may ignore notifications	Use agreed thresholds and prioritisation

Overreliance on automation	Customer receives impersonal communication	Keep customer engagement CSM-led
Training does not address the actual problem	Adoption remains low	Validate the root cause before training
New manager leaves or changes again	Knowledge gap may return	Maintain accessible documentation and repeatable onboarding
Temporary usage increase	Customer may be marked recovered too early	Monitor sustained activity before closing the intervention
Inaccurate health status	Poor account prioritisation	Combine product usage, support, and customer engagement data

---

11. Expected Outcomes

If implemented effectively, this approach should help Okonkwo FinTech Solutions:

- Detect important product adoption gaps earlier.
- Identify customers who need additional training or support.
- Reduce prolonged inactivity in key workflows.
- Improve onboarding when customer stakeholders change.
- Help customers use important product features independently.
- Give CSMs better visibility into customer health.
- Establish a repeatable process for adoption recovery.
- Support customer retention through improved product value.

The intended outcome is not merely more product activity. It is a customer who understands the product, can complete important workflows, and continues receiving value from the subscription.

---

12. My Key Takeaways

This case study demonstrates an important distinction between customer support and proactive customer success.

A support-focused response might wait for the new manager to raise a complaint about inventory reconciliation.

A proactive CSM approach recognises that prolonged inactivity in an important workflow is a signal worth investigating.

Instead of sending a generic reminder, I would review the customer's usage history, understand the change in personnel, identify the actual blocker, arrange targeted assistance, and measure whether the customer resumes the workflow.

I would also use the experience to improve the company's broader customer onboarding and health monitoring process.

My approach is to identify adoption risks early, understand the reason behind them, provide the right intervention, and verify that customers are receiving value from the product.

Project status: Case study and proposed customer health automation workflow. The monitoring system, integrations, customer outreach, and adoption recovery described here are proposed actions, not a claim of completed production implementation.
